

February 2009

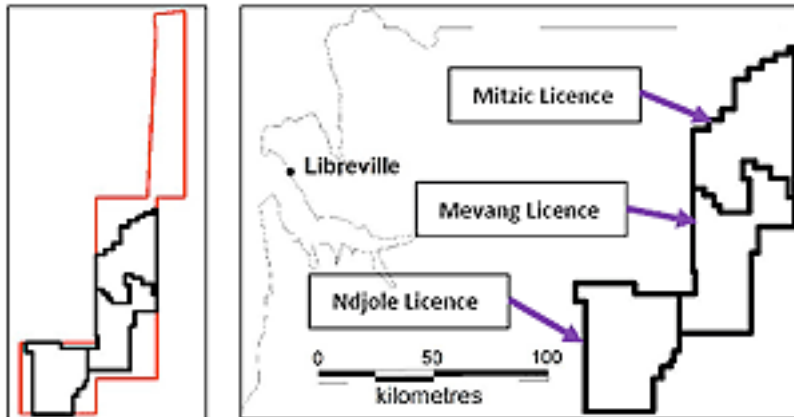

**Property Highlights:**

- 6,000 sq km of geology similar to that of Canadian, Brazilian and Australian shields
- Archaean greenstone belts un-explored for gold with modern exploration methods
- Extensive artinsal gold workings over Palaeo-Proterozoic sediments un-explored with modern exploration methods (Ndjole region)
- Numerous manganese occurences never before evaluated which lie immediately adjacent to a manganese resource currently undergoing feasibility
- Over 70km of magnetic highs which correspond to Banded Iron Formations never assessed for deposits of iron ore

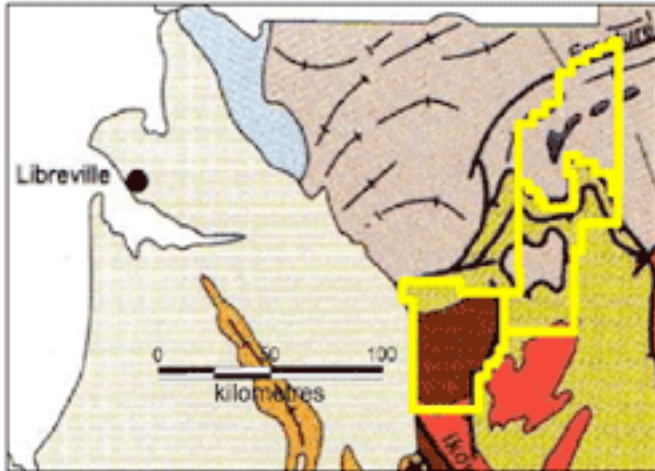

**Gabon Facts:**

- Peaceful democracy with most recent elections in December 2006
- One of the most prosperous nations, per capita, in Africa, as a result of oil production
- Francophone; strong friendly ties with France and neighbouring countries
- Strong mining history in manganese and uranium
- Implementing €35 million aid program in support of national minerals exploration

**Mineral Focus: Gold, Iron, Manganese**

*Outline of Dome's old prospecting permit (red) with the new exploration licences (black). The new licences cover 6000 sq. km of ground.*

*Geological setting of Dome's properties in Gabon (Pink = Archaean; Green/Brown = Deformed Proterozoic)*

*Target areas: Yellow=Gold, Pink=Manganese, Green=Iron*
